Transition

- Dynamic Transition Message:
 - Project Title
 - Loading
 - Closing

* * * * * C L O S I N G

[illegible]

Delay

- This function freezes the compiler for specified time.
- It takes two inputs (number of integer seconds, fractional seconds)
- e.g. `delay(1,33)` delays the program by 1.33 seconds

```
void delay(unsigned time,unsigned decimal){
    int i,j;
    float fraction=(float)(decimal)/100;//for milliseconds
    for (j=0;time!=0 && decimal!=0 && j<time;j++)//e.g. 1.35 second
        for (i=0;i<CPUFACTOR*100000000*(1+fraction);i++);
    for (j=0;time!=0 && decimal==0 && j<time;j++) //e.g. 1.00 second
        for (i=0;i<CPUFACTOR*100000000;i++);
    if (time==0 && decimal!=0) //e.g. 0.21 second
        for (i=0;i<CPUFACTOR*100000000*fraction;i++);
}
```

Main

- Initialize the Data Structure
- Load the contact lists
- Initialize the number of contacts
- Prompt the user Input
- Call Functions (Assign Tasks)

```

void main(){
    system("cls");
    record *phonebook[capacity]; //initialize the instance
    load_data(phonebook); //loading the file containing the contact list
    int task;
    transition(Project_Title); //displays the project title message
    while (1){
        ResetMatches(); //reseting the array of indexes of the matched results
        system("cls");
        header(); //the interface
        scan_int(&task);
        switch (task){
            case 0: /**about me**/
                transition(load); //transition function //Project title
                aboutMe(); //About Me
                system("pause");
                transition(close);
                break;
            case 1: /**Add contact**/
                transition(load); //transition function
                AddContact(phonebook); //New contact function
                system("pause");
                transition(close); //transition function //closing
                break;
        }
    }
}

```

AddContact

- This function adds a new contact to the array of phonebook
- It asks the user to enter the First and Last Names as well as the email address.
- It then creates a signal of existents (`x.exists=1`)

```

void AddContact (record * phonebook) {
    printf("\n\t ***** A D D a C O N T A C T ***** \n");
    printf("\n\t >>>>> Your Memory Usage is %d%% <<<<< \n\n", (counter*100)/capacity);
    int i,k;
    record TempContact; //temporary instant, until the user confirms
    counter++; //number of contact increases by 1
    i=counter-1; /*index for values assignment.
    it will keep its value unless there exists a contact with
    removal signal (x[k].exist==0), then i=k and the counter should not increment
    as the memory is the same*/
    for (k=0;k<counter;k++){
        if (phonebook[k].exist==0){--counter;i=k;break;}
    }
    ////////////USER Prompt//////////
    printf("\n\tFirst Name: ");
    scanf("%s", TempContact.FirstName);
    printf("\tLast Name: ");
    scanf("%s", TempContact.LastName);
    printf("\tEmail: ");
    scanf("%s", TempContact.EmailAddress);
    /*USER CONFIRMATION REQUEST*/
    if(AreYouSure("Add Contacts")==1){
        printf("\n\t $$$$$$$$$$ Contact Successfully Added $$$$$$$$$$\n\n\t");
        phonebook[i].exist=1;
        strcpy(phonebook[i].FirstName,TempContact.FirstName);
        strcpy(phonebook[i].LastName,TempContact.LastName);
        strcpy(phonebook[i].EmailAddress,TempContact.EmailAddress);
    }
    else{//if the user doesn't ant to add
        printf("\n\t No contacts will be added...\n\t");
        --counter; //the counter must be reset to the previous value
    }
}

```

SearchForContact

- This function searches for contact by matching first and last names [CASE SENSITIVE]
- It takes phonebook array as an input.
- Searches only among existing contacts (`x.exist==1`)

```

void SearchForContact(record *phonebook) {
    int i;//index for contacts
    int j=0;//counter for matches
    int firstNameMatch,lastNameMatch;
    char QueryFirstName[StringLength];//search query
    char QueryLastName[StringLength];//search query
    ////////////////////////////////////////////InterFace//////////////////////////////////////////
    printf("\n\t\t\t\t\t***** SEARCH FOR CONTACT *****\n");
    printf("\n\n\n\n\tPlease type the name of the contact");
    printf("\n\n\tFirst Name: ");
    scanf("%s",&QueryFirstName);//First Name Query
    printf("\tLast Name: ");
    scanf("%s",&QueryLastName);//Last Name Query
    ////////////////////////////////////////////
    for (i=0;i<counter;i++){
        //Case Sensitive comparison
        firstNameMatch=strcmp(QueryFirstName, phonebook[i].FirstName) == 0;//1 if matches 0 otherwise
        lastNameMatch=strcmp(QueryLastName, phonebook[i].LastName) == 0;//1 if matches 0 otherwise
        /*!!!!!!!!!!!!!!!!!!!!!! Display !!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!*/
        if (phonebook[i].exist==1 && firstNameMatch && lastNameMatch){
            contact_matched[j]=i;/*reserving the index of the matched contact
            for further references */
            j++;//counter for matches
            printf("\n\t (%d)\n\t %s %s's email is: %s\n\n",j,phonebook[i].FirstName, phonebook[i].Last
        }
    }
    //for loop
    if (j==0){printf("\n\n\t***** No Matches Found *****\n\n\t");}
    else if(j>1) { //if there's more than 1 match
        printf("\t***** %d Matches Found *****\n\n\t",j);
    }
}

```

Your contact of interest is #

Options

- This function is executed after listing All or searched contacts.
- The user is asked to select the contact of interest.
- The user is then asked to select the action to be performed on the contact:
 - 1)go to homepage
 - 2)Copy the contact's email to clipboard
 - 3)Delete the contact
 - 4)Back to the list of contact

```

void options(record * phonebook){
    char action;int i;fflush(stdin);
    int k; //index for match of interest
    //if there's no contacts/ no matches
    if (contact_matched[0]==-1){system("pause");return;}

    /**_____Contact of interest_____**/
    //This is executed if there's more than 1 match
    if (contact_matched[1]!=-1){
        printf("\n\t**Enter 0 to go back**\n\tYour contact of interest is #");
        scan_int(&k); //scanning the user choice of the contact
        i=contact_matched[k-1]; //index of the selected matched query
        if (k==0){
            return;
        }
        else if (i==-1){ //checking that the user chose a number within the range
            printf("\n\t****ERROR..Select From The contacts On The List****\n\n\t");
            options(phonebook);
        }
        else if(phonebook[i].exist==0){ //checking that the user didn't choose a contact he already
            printf("\n\t****ERROR...you have already deleted this contact****\n\n\t");
            options(phonebook);
        }
        printf("\n\t *[ %s %s's email is: %s ]*\n",phonebook[i].FirstName, phonebook[i].LastName,
        )else{i=contact_matched[0];} //index of the only matched contact

    /**_____Action Type_____**/

    printf("\n\n\t *Homepage(H)   *Copy(C)   *Delete(D)   *Select another(S)\n\t>>");
    fflush(stdin);
    scanf("%c",&action);
    if (action=='H' || action=='h'){ //go to home screen
        return;
    }
    else if (action=='C' || action=='c'){ //copy to clipboard
        copy_to_clipboard(&phonebook[i].EmailAddress);
        options(phonebook);
    }
}

```

DeleteContact

- This function deletes specific contact.
- It takes two inputs
 - the phonebook instance array
 - the specific index of the contact.
- It then sends a removal signal by assigning 0 to "exist" the parameter (i.e. `x[i].exist=0`)

```

void DeleteContact (record * phonebook, int i) {

    if(AreYouSure("delete this contact")==yes){
        //sending a signal of removal
        phonebook[i].exist=0;
        printf("\n\t $$$$Contact Deleted, He wasn't nice anyways!!\n\t");
        printf("\n\t ----- \n\t");
    }
    else{
        printf("\n\t$$$ oops.. my bad !!\n\t");
        printf("\n\t ----- \n\t");
    }
}

/*****/

```

Scan_int

- This function checks the scanned integers
- Performs error analysis

```
2  int scan_int(int* value){
3      int status, flag=0;
4      while(flag!=1){
5          status=scanf("%d", value);
6          fflush(stdin);
7          if (status==0) {
8              printf("\n\n\t***** ERROR..Enter a Number Please *****\n");
9              printf("\n\t>>");
10
11          }
12          else {flag=0;return value;}
13      }
14  }
```

AreYouSure

- Checks if the user is sure of the operation he commanded
- It takes the message to be displayed as an input
- i.e. AreYouSure("Delete All Contacts");

```
int AreYouSure(char x[]) {  
    char isSure='y';  
    printf("\tAre you sure you want to %s? y/n \n\t>>", x);  
    fflush(stdin); //flushing carriage return  
    scanf("%c", &isSure);  
    if (isSure=='y' || isSure=='Y') {return(yes);} // if not sure  
    else if (isSure=='n' || isSure=='N') {return(no);}  
    else {AreYouSure(x);}  
}
```

```
"C:\Users\user\Google Drive\Fall'15\ECEN210\Project\Interface\bin\Debug\Interface.exe"

Press any key to continue . . .
```

Save_Data

- This function stores the updated contacts list in a file ready for retrieval after closing the application.
- It only stores the contacts which have existence signal of 1 (x.exist=1)

```
void save_data(record * phonebook){
    int i=0;
    fWrite = fopen("phonebook_contacts.dat", "w");
    if ( fWrite == NULL ){
        perror("The following error occurred ");
        exit(EXIT_FAILURE);
    }
    else{
        for (i=0;i<counter;i++){
            if(phonebook[i].exist==1)
                fprintf(fWrite, "%d\t%s\t%s\t%s\n",phonebook[i].exist,phonebook[i].FirstName, phonek
        }

    }
    printf("\n\t****Data Saved****\n\n");
    fclose(fWrite);
}
```
